Builder

Sunday, 18 January 2026 10:37 AM

Test data
↳ large object
↳ nested objects

Makes the task of create large / complex objects easier.

@Builder → lombok

Query → SQL query.
↳ select
↳ columns
↳ table
↳ where
↳ group by
↳ order by

sequence.

Approach

→ hard-coded queries

```
obc.query = " ———————— ";
```

→ use a builder pattern,

```
QueryBuilder.select(—)
            .columns(—)
            .table(—)
            .where(—)
            .groupBy(—)
            .build();
```

QueryBuilder
↳ select
↳ columns
↳ where
↳ table
↳ order
↳ groupBy

Setter

```
public void setSelect(String select){
    this.select = select;
}
```

Builder

```
public QueryBuilder select(String select){
    this.select = select;
    return this;
}
```

→ makes chaining possible

eg. select
.where
...

method chaining.

```
public Query build(){
    — validations
    Query query = new Query();
    return query;
}
```
