Factory

Sunday, 11 January 2026 10:40 AM

Factory Design pattern

- → creational design pattern
- → create objects of the same family
  - ↓ subclasses of the same type.

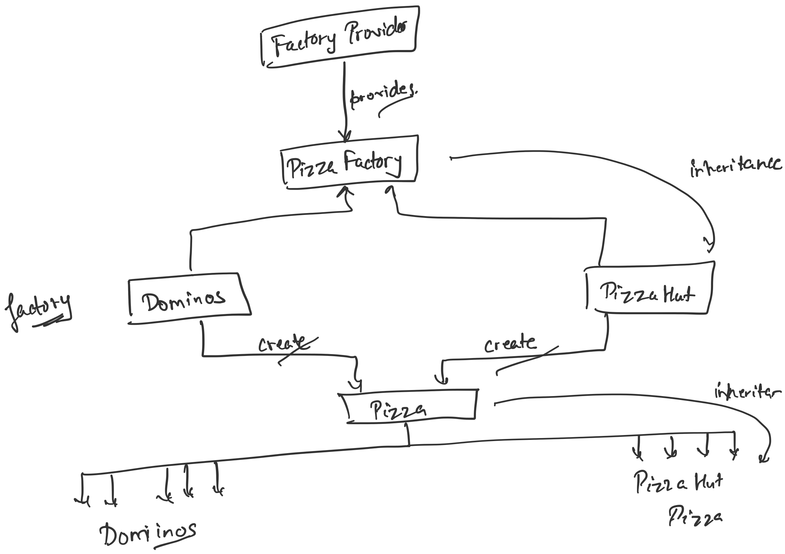
Pros:
- → Easy to add new types into the system.
- → Enhances maintainability.

Pizza Factory
- create → Pizza
  - Veggie
  - Non-Veg
  - Cheese
  - Margerita

```
Pizza p1 = new Veggie();
       p2 = new Cheese();
       ⋮
```

```
class PizzaFactory () {
    public static Pizza getPizza (String type){
        if ( type == "Veggie")
            return new Veggie();
            ⋮
    }
}
```

```
PizzaFactory factory = new PizzaFactory();
Pizza p1 = factory.getPizza ("Veggie");
```

Abstract factory


- → extension of factory
- → when dealing with multiple families of same type.
